

Shortage of medicines - how to address an emerging problem

2020/2071(INI) - 17/09/2020 - Text adopted by Parliament, single reading

The European Parliament adopted by 663 votes to 23, with 10 abstentions, a resolution on shortage of medicines - how to address an emerging problem.

The long-standing problem of shortages of medicines within the EU has worsened during the COVID-19 pandemic, with direct negative consequences for the health and safety of patients and the continuation of their treatment.

Parliament called for the establishment of a genuine pharmaceutical industrial strategy to enable the EU to regain its health sovereignty and called for better coordination between EU countries to address the drug shortage.

The European response to the shortage of medicines shall be based on four pillars:

(1) Restoring the EU's independence in health matters by securing supply

With 40% of medicines marketed in the EU today coming from third countries and between 60-80% of chemical active substances being produced in China and India, Parliament considered it geostrategically imperative for the EU to regain its independence in the field of healthcare, to ensure a rapid and efficient supply of medicines, medical equipment, diagnostic tools and vaccines at affordable prices and to prevent shortages in these areas, giving priority to the interests and safety of patients.

Members called on the Commission and Member States to:

- take the necessary measures to guarantee the security of supply of medical products, reduce the EU's dependence on third countries and support the local manufacture of medicines of major therapeutic interest, giving priority to medicines of health and strategic interest;
- establish a precise mapping of potential production sites within the European Union in order to be able to preserve, modernise and strengthen their capacity where necessary;
- make the shortage of medicines one of the pillars of the Commission's forthcoming pharmaceutical strategy and create a Pharmaceutical Forum, overseen by the European Medicines Agency, bringing together relevant stakeholders in the healthcare supply chain to prevent shortages;
- introduce financial measures and incentives in line with state aid rules in order to encourage the industry to locate its activities in Europe, from the production of active ingredients to the manufacturing, packaging and distribution of medicines;
- consider setting up harmonised shortage prevention and management plans that require manufacturers to identify drugs of major therapeutic interest that require the introduction of measures to avoid supply disruptions;
- make security of supply a priority criterion in drug-related tendering procedures;

- create one or more non-profit European pharmaceutical undertakings capable of producing certain medicines of strategic importance for health care in emergencies, in the absence of existing industrial production, in order to prevent possible shortages of medicines in case of emergency;
- assess foreign direct investment in pharmaceutical production sites, which are part of Europe's essential health infrastructure;
- creating an environment to ensure that Europe continues to be an attractive location for R&D investment to encourage research, development and manufacturing in Europe and to ensure that Europe remains the leading region in the world for the manufacture of active ingredients for patent medicines.

Members called for joint action on the prevention of shortage of medicines, to be funded by the future health programme.

(2) Strengthen European action to better coordinate and complement Member States' health policies

Parliament recommended:

- greater transparency in the production and distribution chain of medicines and the creation of a European unit for the prevention and management of shortages;
- the development of health strategies at European level with a common basket of drugs against cancer, infectious diseases, rare diseases and in other areas particularly affected by shortages, as well as examining the possibility of setting harmonised criteria for pricing to make these medicines affordable;
- the creation of a European contingency reserve for medicinal products of health and strategic importance (MISSs) that are at high risk of shortage, along the lines of the 'RescEU' mechanism, in order to alleviate recurrent shortages and create an emergency European pharmacy;
- the development of innovative and coordinated strategies and the strengthening of the exchange of best practices in stock management;
- the introduction of new European joint procurement procedures to combat shortages, particularly in times of health crises, with simplified and transparent procedures for greater responsiveness.

(3) Strengthening cooperation among Member States

Members considered it essential to improve early communication to both health professionals and patients on the availability of medicines through innovative digital tools. Member States shall share information such as epidemiological forecasts with all relevant stakeholders to help them plan their activities better in the face of rising demand and respond better to needs at times of shortages.

Members pointed out that misinformation can lead to the inappropriate use of medicines and the creation of unnecessary stockpiling.

(4) Preventing and responding to shortages in the event of health crises

Parliament called on the Commission, in close collaboration with the Member States, to adopt a European pandemic preparedness plan in order to ensure a coordinated and effective response. It also called for simplified legislation and more flexible regulatory measures in times of crisis to alleviate shortages and facilitate the movement of medicines between Member States, such as the acceptance of different packaging formats, extended expiry dates or the use of veterinary medicines.
