# Conservation of Antarctic marine living resources: fishing control

1995/0252(CNS) - 28/03/1996 - Legislative proposal

The proposal in question, which was amended before Parliament had delivered its opinion, is seeking to make a number of technical alterations related to new conservation measures adopted by the CCAMLR after the initial proposal was submitted (measures adopted at that Commission's annual meeting from 24 October to 3 November 1995). The main purpose of the measures is to set new TACs for the Euphausia superba, Disssostichus eleginoides, Champsocephalus gunnari, Electrona carlsbergi, and Lepidonotothen squamifrons species, and crabs. The new Regulation makes three kinds of alterations: - de facto changes, taking into account the new TACs and fishing years laid down at the CCAMLR annual meeting, - less cumbersome administrative procedures for catch reports and other information to be notified, and - changes in anticipation of future amendments to the Regulation. The amendments in question, technical alterations, primarily to TACs and fishing years, will be adopted by a management committee chaired by the Commission.
