Final act
Directive 2026/0805 OJ OJ L 20.04.2026 Summary

Protection of groundwater against pollution and environmental quality standards in the field of water policy

2022/0344(COD) - 12/07/2023 - Committee report tabled for plenary, 1st reading/single reading

The Committee on the Environment, Public Health and Food Safety adopted the report by Milan BRGLEZ (S&D, SI) on the proposal for a directive of the European Parliament and of the Council amending Directive 2000/60/EC establishing a framework for Community action in the field of water policy, Directive 2006/118/EC on the protection of groundwater against pollution and deterioration and Directive 2008/105/EC on environmental quality standards in the field of water policy.

This new legislative proposal presented by the European Commission brings forward a revision of the Water Framework Directive together with its two 'daughter' Directives, the Groundwater Directive and the Environmental Quality Standard Directive with the purpose to improve the EU water legislation towards achieving its overarching objective of protecting human health and natural ecosystems from toxic pollutants.

The committee responsible recommended that the European Parliament's position adopted at first reading under the ordinary legislative procedure should amend the proposal as follows:

Progressive reduction of priority hazardous substances

According to Members, the Commission should adopt the necessary legislation and Member States shall implement the necessary measures to progressively reduce pollution discharges, emissions and losses from priority substances, and to cease or phase out emissions, discharges and losses of priority hazardous substances within an appropriate timeline and, in any case, not later than **20 years after** a given priority substance is listed as hazardous in Part A of Annex I to Directive 2008/105/EC.

That timeline should apply without prejudice to the application of stricter timelines in any other applicable Union legislation.

Emerging and new substances

Members proposed that the watch list - which lists substances or groups of substances for which there are indications that they present a significant risk to human health and the environment - should not be limited to a maximum number as proposed by the Commission. The watch list should contain at least **five substances or groups of substances** and specify, for each substance, the applicable monitoring matrices and any analysis methods. This list should be updated regularly to take account of new scientific evidence.

The substances or groups of substances to be placed on the watch list should be selected from among those substances which, on the basis of available information, could pose a significant risk at Union level to or via the aquatic environment, and for which monitoring data are insufficient. In addition to the minimum number of substances or groups of substances, the watch list could also contain pollution indicators.

Members propose that a number of substances be added to the list as soon as appropriate monitoring methods have been identified. These include micro-plastics, antimicrobial resistant micro-organisms and certain antimicrobial resistance genes, as well as possibly sulphates, xanthes and non-relevant metabolites of pesticides.

Groundwater pollution

Members considered that a precautionary approach should be applied when setting groundwater threshold values to protect human health, groundwater ecosystems and groundwater-dependent ecosystems. The threshold values applicable to groundwater should normally be **10 times lower than the corresponding threshold values for surface waters**. However, where the actual risk posed to the groundwater eco-systems can be established, it could be appropriate to set threshold values for groundwater at a different level.

Each Member State should select at least two monitoring stations, plus the number of stations equal to its total area in km² of groundwater bodies divided by 30 000.

The Commission should, not later than four years after the date of entry into force of this Directive, publish an assessment of the impacts of physico-chemical elements, like pH, oxygenation, and temperature, on health of groundwater ecosystems, accompanied, where appropriate, by a legislative proposal to revise this Directive accordingly, in order to set the corresponding parameters, provide for harmonised monitoring methods, and define what would constitute a good ecological status for groundwater.

The Commission should publish an assessment of the chemical status of areas characterised by high ecological value, vulnerability or pollution, such as caves and karst areas, former industrial sites and other areas with known historical contamination, accompanied, where appropriate, by a legislative proposal to revise this Directive.

Members also wanted a subset of specific PFAS (perfluoroalkylated and polyfluoroalkylated substances) and '**PFAS Total**' (a parameter that includes all PFAS with a maximum concentration) to be added to the list of groundwater pollutants. They also want stricter standards for glyphosate, bisphenol (bisphenols total), atrazine, pharmaceuticals and non-relevant metabolites of pesticides.

In particular, the report proposed the adoption of the following EQS for **glyphosate**, based on the precautionary principle: a common, unified environmental quality standard expressed as an annual mean value (AA-EQS) of 0.1 µg/L for inland surface waters; a common, unified environmental quality standard expressed as an annual mean value (AA-EQS) of 0.01 µg/L for other surface waters.

Extended producer responsibility

According to Members, introducing the provision on extended producer responsibility would ensure the respective legislation lives up to the polluter pays principle particularly when it comes to financing of monitoring programmes. The Commission is called on to examine the creation of an extended producer responsibility **mechanism**.

Access to justice

The report proposes to enhance the provision on access to justice in environmental matters by concretely defining this right within the relevant legislation and thereby ensuring national courts across the Union abide by this provision making possible for the applicants to be able to rely on national laws when challenging decisions by public authorities that are in breach of the water framework directive.

Protection of groundwater against pollution and environmental quality standards in the field of water policy

2022/0344(COD) - 12/09/2023 - Text adopted by Parliament, partial vote at 1st reading/single reading

The European Parliament adopted by 495 votes to 12, with 124 abstentions, **amendments** to the proposal for a directive of the European Parliament and of the Council amending Directive 2000/60/EC establishing a framework for Community action in the field of water policy, Directive 2006/118/EC on the protection of groundwater against pollution and deterioration and Directive 2008/105/EC on environmental quality standards in the field of water policy.

The matter was referred back to the committee responsible for inter-institutional negotiations.

Common good and a heritage

Parliament underlined that water is a public good for the benefit of all which, as an essential natural resource that is irreplaceable and indispensable to life, needs to be carefully considered in the light of its social, economic and environmental dimensions. Climate change, including the increased frequency of natural disasters and extreme weather events, and the degradation of biodiversity, both negatively affect water quality and quantity, leading to pressure on sectors dependent on the availability of water, particularly agriculture.

Progressive reduction of priority hazardous substances

According to Members, Member States should implement the necessary measures to progressively reduce pollution discharges, emissions and losses from priority substances, and to cease or phase out emissions, discharges and losses of priority hazardous substances within an appropriate timeline and, in any case, **not later than 20 years** after a given priority substance is listed as hazardous in Part A of Annex I to Directive 2008/105/EC.

Emerging and new substances

The number of substances or groups of substances to be monitored and analysed under the watch lists for surface water and groundwater should **not be limited**.

Members proposed that the **watch list** - which lists substances or groups of substances for which there are indications that they present a significant risk to human health and the environment - should contain **a minimum of five substances or groups of substances of emerging concern** selected from amongst those substances for which the information available, also in accordance with sub-paragraph four below, indicates that they may pose a significant risk at Union level to, or via, the aquatic environment, and for which the monitoring data are insufficient. This list should be updated regularly to take account of new scientific evidence.

In addition to the minimum number of substances or groups of substances, the watch list could also contain **pollution indicators**.

Members propose that a number of substances be added to the list as soon as appropriate monitoring methods have been identified. These include micro-plastics, antimicrobial resistant micro-organisms and certain antimicrobial resistance genes, as well as possibly sulphates, xanthates and non-relevant metabolites of pesticides.

Groundwater pollution

Members considered that a **precautionary approach** should be applied when setting groundwater threshold values to protect human health, groundwater ecosystems and groundwater-dependent ecosystems. The threshold values applicable to groundwater should normally be **10 times lower than the corresponding threshold values for surface waters**. However, where the actual risk posed to the groundwater eco-systems can be established, it could be appropriate to set threshold values for groundwater at a different level.

Each Member State should select at least two monitoring stations, plus the number of stations equal to its total area in km² of groundwater bodies divided by 30 000.

Members also wanted a subset of specific PFAS (perfluoroalkylated and polyfluoroalkylated substances) and 'PFAS Total' (a parameter that includes all PFAS with a maximum concentration) to be added to the list of groundwater pollutants. They also want stricter standards for glyphosate, bisphenol (bisphenols total), atrazine, pharmaceuticals and non-relevant metabolites of pesticides.

Based on the precautionary principle, a common and unified AA-EQS for inland surface waters and, separately, for other surface waters, should be adopted in relation to **glyphosate**.

Extended producer responsibility

Members considered that, in accordance with the polluter pays principle, producers placing on the Union market products that contain substances which have a proven or potential negative impact on human health and the aquatic environment take **financial responsibility** for the measures required to control substances generated in the context of their commercial activities and found in surface water and groundwater. The Commission is called on to examine the creation of an extended producer responsibility mechanism.

European monitoring facility

Monitoring of an increased number of substances or group of substances involves increased costs but also the need for strengthened administrative capacity in the Member States, especially those with scarcer resources. In light of the above, the Commission should set up a joint European monitoring facility for managing the monitoring requirements when so requested by the Member States, thus easing their financial and administrative burdens. The use of such facility should be voluntary.

Access to justice

Member States should ensure that members of the public, in accordance with national law, that have a sufficient interest or that allege the impairment of a right, have access to a review procedure before a court of law, or another independent and impartial body established by law, to challenge the substantive or procedural legality of all decisions, acts or omissions under this Directive.

Protection of groundwater against pollution and environmental quality standards in the field of water policy

PURPOSE: to ensure a high level of environmental protection and improve the environmental quality of European freshwaters.

LEGISLATIVE ACT: Directive (EU) 2026/805 of the European Parliament and of the Council amending Directive 2000/60/EC establishing a framework for Community action in the field of water policy, Directive 2006/118/EC on the protection of groundwater against pollution and deterioration and Directive 2008/105/EC on environmental quality standards in the field of water policy.

CONTENT: this directive amends the Water Framework Directive, the Groundwater Directive and the Environmental Quality Standards Directive, aligning European water policy with the latest scientific data.

The directive aims to **update the list of pollutants that threaten surface water and groundwater**. The revised rules also tighten environmental standards for several substances and strengthen monitoring across the EU.

Groundwater and surface water alert lists

The watch lists for both groundwater and surface water must be established by implementing act within **two years** and then revised every three years. The directive makes monitoring of substances on the watch lists **mandatory** in groundwater and streamlines the monitoring procedure for substances on the watch lists for surface water and groundwater.

The directive also adds **microplastics and antimicrobial resistance** to future watch lists as soon as appropriate methods have been developed, so that data on their concentration in water can be collected to facilitate the development of a risk assessment method.

Monitoring

Regarding the frequency of monitoring of substances behaving as **persistent, bioaccumulative, and toxic (PBT) substances**, Member States may carry out less intensive monitoring than that required for priority substances, but such monitoring must take place at least every three years. **Effects-based monitoring methods** will be mandatory for two years for estrogenic substances in surface waters, to allow the Commission to collect data.

List of substances

To improve water quality, the EU has already put in place rules to monitor and reduce discharges of identified hazardous substances and pollutants into surface water and groundwater. The list of these substances for the entire EU has been expanded and updated, and now includes:

- **pharmaceutical products** (such as painkillers): a uniform quality standard is set for the various pharmaceutical substances of national concern in groundwater;
- **pesticides**: with regard to **groundwater**, the directive retains the 'median value' of 1 µg/l and a total of 5 µg/l while allowing Member States to set a more or less strict individual standard if this is justified by available data on the toxicity of the substance; with regard to **surface water**, a quality standard for the sum of pesticides which are already on the list of priority substances to be monitored is set, with a value of 0.2 µg/l for fresh water;
- **per- and polyfluoroalkyl substances (PFAS, a group of 'forever chemicals')**: with regard to surface waters, the directive sets a strict standard of 0.0044 µg/l for a sum of 24 PFAS and also adds TFA (trifluoroacetic acid) to this sum of 24 PFAS, to make it a sum of 25 PFAS;
- **bisphenol A**, now classified as a priority hazardous substance, while **atrazine** is declassified.

For the first time, the directive establishes rules for assessing the **cumulative risk** arising from the combination of substances.

Monitoring and reporting obligations

The updated directive strengthens monitoring and reporting obligations for EU countries, aiming to improve water quality and transparency across the EU. Furthermore, Member States will be able to use remote sensing and Earth observation technologies for their monitoring. They must report on the biological quality, chemical quality, and overall status of water bodies to ensure more reliable data across the EU.

Joint monitoring mechanism

The Commission will be responsible for assessing the feasibility of setting up a common surveillance mechanism to help Member States, on a voluntary basis, to manage surveillance requirements.

Extended producer responsibility

The Commission will prepare, within three years of the entry into force of the amending directive, a report assessing, in particular, the possibility of requiring producers who place on the EU market products containing priority substances and priority hazardous substances to contribute to the costs of monitoring programmes.

Cross-border cooperation

The directive strengthens cross-border cooperation, ensuring that affected Member States and the Commission are immediately informed of exceptional circumstances related to extreme flooding, prolonged droughts or accidental transboundary pollution, and that adequate cooperation is put in place.

ENTRY INTO FORCE: 10.5.2026.

TRANSPOSITION: no later than 21.12.2027. As regards, the compliance deadline for newly identified substances, the Directive foresees for both surface and groundwater compliance by the **end of 2039**, with a possibility to apply time-related exemptions for one more cycle, i.e. up to end 2045.

Protection of groundwater against pollution and environmental quality standards in the field of water policy

2022/0344(COD) - 26/03/2026 - Text adopted by Parliament, 2nd reading

The European Parliament adopted a legislative resolution **approving** the Council's position at first reading with a view to the adoption of the Directive of the European Parliament and of the Council amending Directive 2000/60/EC establishing a framework for Community action in the field of water policy, Directive 2006/118/EC on the protection of groundwater against pollution and deterioration and Directive 2008/105/EC on environmental quality standards in the field of water policy.

The proposal amending the Water Framework Directive (WFD), the Environmental Quality Standards Directive (EQSD) and the Groundwater Directive (GWD) aims to update the annexes to these directives, which contain the list of pollutants and quality standards, to improve monitoring of chemical mixtures, streamline future updates according to scientific findings, improve access to, transparency and re-use of data and set new standards for a series of substances of emerging concern.

The main elements of the Council's position are as follows:

Watchlists

The watchlists for both groundwater and surface water are to be established by implementing act within **two years**, and revised every three years, thereafter. Member States are to monitor each substance or group of substances in the watch list at selected representative monitoring stations over a **24-month period**, with minimum monitoring frequencies (at least once a year for groundwater and twice a year for surface water).

The watchlists are capped at a maximum of **five substances** or groups of substances for groundwater and of **ten substances** or groups of substances for surface water. **Microplastics and indicators of antimicrobial resistance** will only be included provided that reliable methods of sampling and analysis are available. The Commission is tasked with developing such methods within 18 months.

Monitoring

In relation to the monitoring frequency of substances behaving like **ubiquitous persistent, bioaccumulative and toxic substances (uPBTs)**. Member States may monitor these substances less intensively than is required for priority substances, but such monitoring should take place **at least every three years**. Regarding seasonal variations in monitoring, Member States are to consider peaks of substance use when planning their monitoring. A voluntary encouragement for digitalisation of monitoring is also foreseen.

Effect-based monitoring is mandatory for **estrogenic substances** in surface water during a 2-year period, in order to allow the Commission to collect data. The Commission will set out the technical specifications for this monitoring by implementing act.

Joint Monitoring Facility

The Commission will assess the feasibility and then the possible establishment of the Joint Monitoring Facility. The use of the facility by Member States is voluntary.

Reporting

The Council's position includes the following: (i) reporting of water status will continue to take place within the six-yearly river basin management plans; (ii) monitoring data related to biological quality elements in surface waters must be reported **every 3 years**; (iii) monitoring data related to chemical quality elements in surface water and groundwater is to be reported every **two years**. The new reporting obligations should be fully aligned with existing electronic data delivery mechanisms.

Substances

Regarding PFAS, the sum of PFAS for groundwater is aligned with the Drinking Water Directive, which sets a quality standard (QS) for the sum of 20 PFAS. In addition, a **QS of 0.0044 µg/l** for the sum of 4 PFAS which are recognised as posing a significant risk to human health and the environment is included for groundwater. For surface water, **one substance (TFA) is added** to the list and the Commission will consider whether TFA should have its own separate quality standard.

On pesticides, for groundwater, a QS for non-relevant metabolites of pesticides is simplified. In addition, the Commission will establish by implementing act a list of known pesticide metabolites. For surface water, the total pesticides environmental quality standard (EQS) is set for the sum of the pesticides that are already included in the list of priority substances to be monitored (except the four pesticides to be monitored in biota or sediment and glyphosate) with a value of 0.2 µg/l for freshwater.

Bisphenol-A is designated as a priority hazardous substance, while **atrazine** is deselected.

New annexes introduce groups of substances (pesticides, pharmaceuticals, bisphenols) to be re-examined. In the future, the Commission will be able to set overall standards for these groups in surface and groundwater.

Extended producer responsibility

The Commission is to prepare a report, within 3 years of the entry into force of this amending Directive, to evaluate, in particular, the feasibility of imposing the obligation on producers that place products containing priority substances and priority hazardous substances on the EU market to contribute to the costs of monitoring programmes established in accordance with the WFD.

Protection of groundwater against pollution and environmental quality standards in the field of water policy

2022/0344(COD) - 26/10/2022 - Legislative proposal

PURPOSE: to update lists of water pollutants to be more strictly controlled in surface waters and groundwater.

PROPOSED ACT: Directive of the European Parliament and of the Council.

ROLE OF THE EUROPEAN PARLIAMENT: the European Parliament decides in accordance with the ordinary legislative procedure and on an equal footing with the Council.

BACKGROUND: EU water legislation shares an overarching objective of protecting human health and the environment from the combined effects of toxic and/or persistent pollutants.

This proposal covers amendments to three Directives:

- Directive 2000/60/EC establishing a framework for Community action in the field of water policy,
- Directive 2006/118/EC on the protection of groundwater against pollution and deterioration,
- Directive 2008/105/EC on environmental quality standards (EQS) in the field of water policy.

The Commission conducted a review of the list of priority substances in the Annexes of the Directives and concluded, in the light of new scientific knowledge, that it is appropriate to amend those lists.

PURPOSE: with this proposal, the Commission aims to protect European citizens and natural ecosystems from risks posed by pollutants and their mixtures. The ultimate aim of the initiative is to set **new standards** for a series of chemical substances of concern to address chemical pollution in water, to facilitate enforcement based on a simplified and **more coherent legal framework**, to ensure dynamic and **up-to-date information on water status**, facilitated by the European Environment Agency (EEA), and create a more flexible framework for addressing pollutants of emerging concern. This would be based on wide stakeholder involvement as well as sound scientific support from the European Chemicals Agency (ECHA) to ensure maximum synergies and coherence across EU laws on chemicals.

More specifically, the proposal will:

- reduce concentrations of acutely toxic and/or persistent chemicals in surface and groundwater. Benefits will include reduced impacts on the environment, human health, pollinators and agriculture;
- improve the quality of oceans, lakes, rivers, streams, estuaries, and wetlands and of the services they deliver such as clean water, rich soils and a high biodiversity;
- limit or avoid future costs of water treatment by reducing pollution at the source;

make chemical monitoring data more easily available, accessible and re-usable which will be useful for a better safety assessment of chemicals altogether;

- require that Member State authorities warn immediately downstream Member States in the same river basin, as well as the Commission, in case of exceptional circumstances of natural origin or force majeure, in particular extreme floods, prolonged droughts, or significant pollution incidents. This will provide faster and better response to events such as the Oder river pollution from summer 2022;

- work on tools to monitor and develop a policy response to problematic substances, such as microplastics and antimicrobial genes;

- support the 'one substance, one assessment approach' where the same chemical is evaluated in the same way regarding the risk it poses by different EU laws and policies to limit regulatory burden;

- ensure more dynamic and up-to-date information on water status facilitated by the European Environment Agency.

The new rules recognise the **cumulative or combined effects** of mixtures shifting away from the current focus on individual substances solely. Furthermore, the proposal takes account of **seasonal variations** in the amount of pollution, such as in the case of pesticides used by farmers during planting seasons.

The current proposal is also consistent with the recently revised Drinking Water Directive, which enters into force in 2023. By aiming to reduce pollution of surface and groundwaters, it will protect vital drinking water sources and reduce the cost of treatment. The Drinking Water Directive and this proposal address a wide range of pollutants, in particular pesticides, pharmaceuticals and the group of per- and polyfluoroalkyl substances (PFAS).

Budgetary implications

The proposal will have budgetary implications for the Commission (EUR 500 000), the European Environment Agency (EEA) (EUR 7 million) and the European Chemicals Agency (ECHA) (EUR 8.9 million) in terms of human and administrative resources required.

Protection of groundwater against pollution and environmental quality standards in the field of water policy

2022/0344(COD) - 24/04/2024 - Text adopted by Parliament, 1st reading/single reading

The European Parliament adopted by 452 votes to 43, with 83 abstentions, a legislative resolution on the proposal for a directive of the European Parliament and of the Council amending Directive 2000/60/EC establishing a framework for Community action in the field of water policy, Directive 2006/118/EC on the protection of groundwater against pollution and deterioration and Directive 2008/105/EC on environmental quality standards in the field of water policy.

The European Parliament's position adopted at first reading under the ordinary legislative procedure amends the proposal as follows:

Common good and a heritage

Parliament stressed that water is not a commercial product like any other but, rather, a common good and a heritage, which needs to be protected, and treated as such, in order to ensure that ecosystems are preserved and that there is universal access to clean water.

Progressive reduction of priority hazardous substances

According to Members, Member States should implement the necessary measures to progressively reduce pollution discharges, emissions and losses from priority substances, and to cease or phase out emissions, discharges and losses of priority hazardous substances within an appropriate timeline and, in any case, **not later than 20 years** after a given priority substance is listed as hazardous in Part A of Annex I to Directive 2008/105/EC.

Administrative coordination within river basin districts

Member States should notify other Member States that could be adversely affected by the relevant pollution incident. To further improve cooperation and information exchange in the international river basin districts, for all international river basin districts arrangements for emergency communication and response should be put in place.

Emerging and new substances

The number of substances or groups of substances to be monitored and analysed under the watch lists for surface water and groundwater should **not be limited**.

Members proposed that the **watch list** - which lists substances or groups of substances for which there are indications that they present a significant risk to human health and the environment - should contain **a minimum of five substances or groups of substances of emerging concern** selected from amongst those substances for which the information available, also in accordance with sub-paragraph four below, indicates that they may pose a significant risk at Union level to, or via, the aquatic environment, and for which the monitoring data are insufficient. This list should be updated regularly to take account of new scientific evidence.

In addition to the minimum number of substances or groups of substances, the watch list could also contain **pollution indicators**.

Members propose that a number of substances be added to the list as soon as appropriate monitoring methods have been identified. These include micro-plastics, antimicrobial resistant micro-organisms and certain antimicrobial resistance genes, as well as possibly sulphates, xanthates and non-relevant metabolites of pesticides.

Groundwater pollution

Members considered that a **precautionary approach** should be applied when setting groundwater threshold values to protect human health, groundwater ecosystems and groundwater-dependent ecosystems. The threshold values applicable to groundwater should normally be **10 times lower than the corresponding threshold values for surface waters**. However, where the actual risk posed to the groundwater eco-systems can be established, it could be appropriate to set threshold values for groundwater at a different level.

Each Member State should select at least two monitoring stations, plus the number of stations equal to its total area in km² of groundwater bodies divided by 30 000.

Members also wanted a subset of specific PFAS (perfluoroalkylated and polyfluoroalkylated substances) and 'PFAS Total' (a parameter that includes all PFAS with a maximum concentration) to be added to the list of groundwater pollutants. They also want stricter standards for glyphosate, bisphenol (bisphenols total), atrazine, pharmaceuticals and non-relevant metabolites of pesticides.

Based on the precautionary principle, a common and unified AA-EQS for inland surface waters and, separately, for other surface waters, should be adopted in relation to **glyphosate**.

Improving protection of groundwater ecosystems

The Commission should, not later than four years after the date of entry into force of this Directive, publish an assessment of the impacts of physico-chemical elements, like **pH**, **oxygenation**, and temperature, on health of groundwater ecosystems, accompanied, where appropriate, by a legislative proposal to revise this Directive accordingly, in order to set the corresponding parameters, provide for harmonized monitoring methods, and define what would constitute a “good ecological status” for groundwater. It should publish an assessment of the chemical status of areas characterised by high ecological value, vulnerability or pollution.

Extended producer responsibility

Members considered that, in accordance with the polluter pays principle, producers placing on the Union market products that contain substances which have a proven or potential negative impact on human health and the aquatic environment **take financial responsibility** for the measures required to control substances generated in the context of their commercial activities and found in surface water and groundwater. The Commission is called on to examine the creation of an extended producer responsibility mechanism.

European monitoring facility

Monitoring of an increased number of substances or group of substances involves increased costs but also the need for strengthened administrative capacity in the Member States, especially those with scarcer resources. In light of the above, the Commission should set up a joint European monitoring facility for managing the monitoring requirements when so requested by the Member States, thus easing their financial and administrative burdens. The use of such facility should be voluntary.

Access to justice

Member States should ensure that members of the public, in accordance with national law, that have a sufficient interest or that allege the impairment of a right, have access to a review procedure before a court of law, or another independent and impartial body established by law, to challenge the substantive or procedural legality of all decisions, acts or omissions under this Directive.
